

Members of the Nobel committee for physics announce this year's prize.

Nobel Prize in Physics; the last female scientist to win it was Maria Goeppert Mayer, in 1963. "I don't know what to say, I'm honoured to be one of those women," said Strickland. Göran K. Hansson, secretary general of the Royal Swedish Academy of Sciences in Stockholm, said the academy is "taking measures" to encourage more nominations of female scientists, but that those measures did not affect this year's prize.

### POWERFUL PULSES

Short-lived laser pulses allow scientists to spy on processes that are over in a heartbeat. But before Strickland and Mourou's technique, the intensity of such pulses was limited because the high power risked destroying the amplifier needed to create them. The pair's breakthrough was to stretch out a laser pulse in time. This reduced the power of the light and made it possible to use conventional amplifiers, before the pulse is squeezed back together. Because fleeting pulses cause less damage, they have also found uses in laser eye surgery. "Nobels are awarded for a discovery or an invention. This really bridges the two," says John Dudley, an optical physicist at the University of Franche-Comté in Besançon, France.

At 96, Ashkin is the oldest-ever Nobel laureate. His prize-winning work began immediately after the laser's invention, in 1960. Lasers exert a gentle pressure, which Ashkin realized could be used to manipulate tiny objects without damaging them. His experiments with micrometre-sized spheres showed that the particles were drawn to the highest-intensity region in a beam of light. This led to a way to sculpt lasers to trap, levitate and move objects. Ashkin discovered that these 'optical tweezers' could capture bacteria, viruses and living cells. Miles Padgett, an optical physicist at the University of Glasgow, UK, says that the impact of Ashkin's work has been universally recognized. Today, optical tweezers are used in myriad applications, from separating healthy blood cells from infected ones to engineering nanoscale materials. ■

### PRIZES

# Laser tricks win physics Nobel

Laureates include first female winner in 55 years.

BY DAVIDE CASTELVECCHI,  
ELIZABETH GIBNEY & MATTHEW WARREN

A trio of laser scientists has won the 2018 Nobel Prize in Physics for work using intense beams to capture superfast processes and to manipulate tiny objects. The laureates include Donna Strickland, who is the first woman to win the award in 55 years.

Strickland, at the University of Waterloo, Canada, shares half of the prize, worth 9 million Swedish krona (US\$1 million), with her former supervisor, Gérard Mourou, now at the École Polytechnique in Paris. Arthur Ashkin, at Bell Laboratories in Holmdel, New

Jersey, won the other half of the prize.

Strickland and Mourou pioneered a way to produce the shortest, most-intense pulses of light ever created. These are now used throughout science to unravel processes that previously appeared instantaneous, such as the motion of electrons within atoms. Ashkin won the prize for developing 'optical tweezers', beams of laser light that can grab and control microscopic objects such as viruses and cells.

"First of all, you have to think it's crazy, so that was my first thought," said Strickland during the announcement of the prizes on 2 October. "And you do always wonder if it's real."

Strickland is the third woman ever to win the

### AWARDS

# Cancer immunologists scoop medicine Nobel prize

One of the hottest areas in cancer research, immunotherapy can dramatically extend lives.

BY HEIDI LEDFORD, HOLLY ELSE AND  
MATTHEW WARREN

Two scientists who pioneered a new way to treat cancer have won the 2018 Nobel Prize in Physiology or Medicine. James Allison at the University of Texas MD Anderson

Cancer Center in Houston and Tasuku Honjo at Kyoto University in Japan showed how proteins on immune cells can be used to manipulate the immune system so that it attacks cancer cells. The approach has led to therapies that have extended lives, and even wiped out all signs of disease in some people with advanced cancers.

"To have my work really impact people is one of the best things I could think about," said Allison at a press conference on 1 October, the day the 9-million-Swedish-krona (US\$1-million) prize was announced. "It's everybody's dream."

In the 1990s, Allison, then at the University of California, Berkeley, studied a protein,
