Supplementary Figure 1  TUNEL-positive apoptotic bodies in the GCL of ischemic retina. Vehicle or CsA treatment daily began for 1 day before the induction of transient retinal ischemia and continued for 12 h. Higher magnification clearly showed that TUNEL-positive apoptotic bodies were correlated with the nucleus of dying cells in the GCL of vehicle-treated ischemic retina at 12 h (arrows). IPL, inner plexiform layer; GCL, ganglion cell layer. Scale bar, 20 μm (all panels).
