Supplementary Figure 2  Cleaved caspase-3 protein expression in ischemic retina.
Vehicle treatment daily began for 1 day before the induction of transient retinal ischemia and continued for 24 h. Increase of cleaved caspase-3 protein expression was maximal at 24 h in ischemic retina. Values are mean ± SD (n = 4 retinas/group).
*Significant at P < 0.05 or **Significant at P < 0.01 compared with ischemic retina treated with vehicle at 6 or 12 h. nd, non-detectable.
