Figure S5 Plk1 localizes to centrosomes during S-phase. (A, B) HeLa cells stably expressing GFP-Centrin-2 were subjected to immunofluorescence analysis with the antibodies shown. (C-E) HeLa cells were synchronized with double thymidine block, and then subjected to FACS (C), immunoblotting (D) and immunofluorescence (E) at the indicated times after release. DNA was stained with DAPI. Bar, 10 μm.
