

Supplementary Figure

### **Supplementary Figure 1**

Frequencies of the allele(s) or genotype(s) of interest in control populations of various racial descents in each meta-analysis of gene-disease associations (left panel) and odds ratios for the observed genetic association in studies of various racial descents in each meta-analysis of gene-disease associations (right panel). Only the 32 meta-analyses that reached formal statistical significance for the summary odds ratio overall are shown here (excluding those that reached statistical significance only in specific racial descent subgroups). The lay-out is otherwise the same as the lay-out of figures 1 and 2, respectively, in the main paper.
