

Supplementary Fig. 2. Detection of Musashi1 expression using anti-Musashi1 antibody clone (14H1) (Potten & Okano, Differentiation 2003).

A-B. Examination of Musashi1 expression in section of control intestine. Musashi1-positive cells were mainly located in crypts. The expression pattern of Musashi1 detected by 14H1 antibody is broader than that detected by the antibody provided by Chemicon (AB5977).

C-E. Examination of Musashi1 expression in the PTEN mutant intestine section. Musashi1-positive cell cluster can be seen in the villus region (D-E), which is similar to that detected by the antibody provided by Chemicon (AB5977).
