Supplementary Figure 2. Histology of ankle joint.
On PI day 45, hind paws of anti-4-1BB-, anti-4-1BBL-, or control IgG-treated mice were fixed in 10% buffered formalin, decalcified, and embedded in paraffin. Joint sections (5-7 μm) were prepared and stained with hematoxylin and eosin. The sections were examined under a light microscope (original magnification, x100).
