Supplementary Figure 7. *Intraventricular pressures during ischemia and reperfusion in isolated mouse hearts from 2 independent tg mouse lines.* (a) Left ventricular developed pressure (LVDP) and (b) Left ventricular end-diastolic pressure (LVEDP) during no flow ischemia (10–30 min denoted by black bar), and reperfusion (30–70 min) in ntg (blue), tg line 892 (red), and tg line 896 (green) isolated hearts. Mean values ± SEM are reported, $n=5-8$ per group.
